

## Alternate Flows

### Generate Weekly Optimization Digest (UC-04)

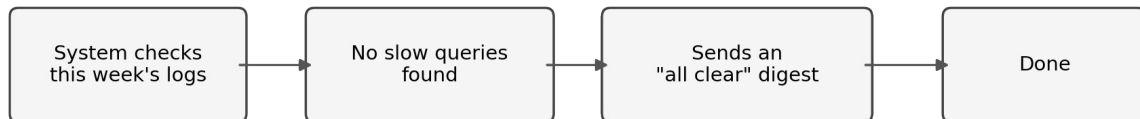

#### Database Query Performance Profiler — Problem Statement #44

An alternate flow is just a different, still-valid path through a use case — nothing breaks, it just doesn't follow the "typical" script step by step. Below are two situations where that happens for the weekly digest.

#### AF-01 — No Slow Queries Logged in the Period

---

Some weeks there simply aren't any slow queries worth flagging — and that's a good thing. Instead of skipping the digest, the system still sends one, just with a friendlier message than usual.

What happens, step by step:

- The system checks the week's logs like it always does.
- It finds nothing that crosses the slow-query threshold.
- Instead of a ranked list of problem queries, the digest just says things looked clean this week.
- That digest still gets saved and sent out to the Backend Lead and DBA as usual.

#### AF-02 — Backend Lead Triggers a Digest On Demand

---

Sometimes the Backend Lead doesn't want to wait until the scheduled run — they just want to see where things stand right now. This flow lets them ask for a digest whenever they need one.

What happens, step by step:

- The Backend Lead clicks "Generate Digest Now" from the dashboard.
- The system quickly checks that they're allowed to do that.
- From there, it's the exact same process as a normal weekly digest — nothing else changes, and the next scheduled run isn't affected.
